ABSTRACTED-PUB-NO: RD 412058A

BASIC-ABSTRACT:

An improvement in a process of metal plating the surface of an object made of a <u>cyclic olefin</u> polymer comprises first immersing the object in an organic solvent which causes swelling at its surface.

USE - In electroless metal plating of cyclic olefin polymers.

ADVANTAGE - Swelling the polymer before acid etching improves the efficiency and uniformity of etching. Strong organic <u>solvents</u> may develop sufficient microporosity to allow the acid <u>etching</u> step before plating to be eliminated.
